

In class Monday:

Jorge: Make review page. A single variable will be passed in when routed to it, the video ID. With the video ID (And user info from Auth()), the user will be able to write a review and give a rating from 1-5 :heh:'s ,the worst being a :diaz:. It will upload to the review to the 'reviews' table and update the rating on the 'video' table.

Owen: Fix bug. Add actors, directors, and genre.

Sydney: Expand on what you have. You will have a user_id from auth() and a video id from the show you are watching. Using these update 'User_Timeline_log'.

Also make it that if there is an entry already the user can choose to start the movie/episode from the beginning or from where they left off.

Steve: Choose one or do both, you are going to be doing both of these eventually: Accounts page and profile page.

Accounts page allows you to update user info like password and maybe email.

Profile page: has friends list (access other user pages from here), has user's reviews they wrote, has users favorites, what they were watching etc...

Alessandro: Work on formatting live search, work with Sydney to make the watch now button work. Make videos a tab on the navbar only accessible to users that watch it. Make users able to subscribe, and if they are subscribed they can watch it.
